ABSTRACTED-PUB-NO: JP09251491A

BASIC-ABSTRACT:

The system includes a first memory which registers skill rank information of many persons. The information regarding service form for each person is stored in a second memory. A reference data for deciding the skill rank of the service person is registered in a third memory. An extract unit refers to the second memory and extracts the skill rank information of the persons with a minimum preknown service form.

A judging unit first finds out the reference data stored in the third memory and then the reference data with the extracted service forms and judges whether the formulation of skill rank is correct or not.

USE/ADVANTAGE - For deciding nurse service schedule in hospitals based on irregular midnight service. Offers service IMS with skill rank checking function.
